AI-Ready Advisor

Results Presentation Notes

What the result screen shows, how the scores are calculated, what each tier means, and exactly what to say when you walk a client (or investor) through their report.

How the result screen is laid out

After Step 7, the page submits and shows **one header ("RESULTS")** followed by **four stacked cards**, then two CTAs. Every client sees the same four cards — only the numbers and the tier message change.

HEADER	**RESULTS**
Card 1	**Readiness Score (1–100)** Big number + tier message
Card 2	**Annual Cost of Inaction** Big dollar figure + explainer
Card 3	**Annual Search Waste** Big dollar figure + explainer
Card 4	**Executive Admin Waste** Big dollar figure + explainer

CTAs	"The Internal Brain System – Get AI Now!" "Get the Full 35-Point Diagnostic (Requires FREE Membership) – Let's Go"

Card 1 — Readiness Score (1–100)

The single most prominent number on the page. Calculated by summing the weighted point values of the radio answers across the six diagnostic pillars (Strategy, Data, Process, People & Leadership, Technology, Security). Each answer carries a hidden numeric weight from **1** (worst) to **4 or 5** (best). The total is normalized to a percentage out of 100.

Score tiers

The page returns a single tier message below the number. We captured the **Low** tier message live. The Mid/High wording mirrors the same structure (acknowledge the situation → recommend a next step).

Tier	Score Range	Tier message
LOW	≈ 0 – 35%	"Your current AI readiness is low — but that's common at the start. Focus first on clean data and basic training to unlock quick wins and avoid falling further behind." [verbatim from the live page]

MID	≈ 36 – 70%	"You have meaningful pieces in place — strategy or data or a willing team — but the gaps are costing you. Standardizing your processes and integrating your systems is the fastest way to unlock the score you already deserve." [structurally inferred — exact wording will match the live page's tone]
HIGH	≈ 71 – 100%	"You're operating at the front of the pack. AI is no longer a question of *if* but *how fast*. Focus on optimization, governance, and capturing first-mover ROI before competitors catch up." [structurally inferred]

What to say when presenting the Score

- **Anchor it as a baseline, not a grade.** Say: "This isn't pass/fail — it's a starting line. The score tells us where the gaps are so we know what to fix first."
- **Tie it to the next 12 months.** A Low score isn't a problem if you address it now; it becomes one in 12 months if you don't. Use that timeframe to create urgency without panic.
- **Refuse to over-claim.** The score is directional, not audited. Anyone who pretends a 7-section quiz is a full diagnostic loses credibility. The honest pitch is: "This is enough to make a decision about whether to invest in a deeper

assessment."

• **Point to which pillar pulled the score down.** The score itself is an average — the value is in the breakdown. Single out the lowest-scoring pillar by name and link it to one concrete next step.

Card 2 — Annual Cost of Inaction

*"Estimated annual cost of **not** adopting AI tools and workflows. This includes lost productivity from manual repetition and delays — most organizations recover this investment in 4–9 months after implementation."* ***[verbatim]***

How it's calculated

Cost of Inaction = Annual Search Waste + Executive Admin Waste
(The page sums Cards 3 and 4 to produce Card 2.)

Example computations

Profile	Inputs	Cost of Inaction / yr
Small shop	5 ppl × 8 h/wk × $40/hr + leader 5 h/wk × $40	≈ $43,160
Mid org	25 ppl × 12 h/wk × $60/hr + leader 8 h/wk × $60	≈ $418,080
Larger SMB	75 ppl × 15 h/wk × $80/hr + leader 10 h/wk × $80	≈ $1,924,560

What to say when presenting the Cost

- **Frame it as a meter, not a verdict.** "This isn't money you've already lost. It's money you'll lose every year going forward if nothing changes. Every week we delay, this meter ticks up."
- **Defend the math.** Be ready to say: "This is based on conservative estimates — 42% of manual time is recovered, which is the middle of

the published range (30–50%). Real numbers are usually higher, but we don't want to oversell."

- **Anchor the 4–9 month payback line.** This is the line that makes CFOs lean forward. "Most organizations recover this investment in 4–9 months" — use it explicitly.
- **Convert to per-week if the annual number is huge.** $1.9M / yr = $36,500/wk. A weekly figure lands harder for owners who don't think in annual P&L.

Card 3 — Annual Search Waste

"Annual time & money lost when employees search for files, emails, docs, or answers. AI-powered internal search (e.g. enterprise RAG) typically reduces this waste by 70–90%." ***[verbatim]***

How it's calculated

Search Waste = Headcount × Staff Manual Hours/week × Hourly Rate × 52 × 0.42

The **0.42** is the form's built-in assumption that ~42% of manual hours are pure recoverable waste — searching, re-entering, and reconciling data.

What to say when presenting Search Waste

- **Name the work.** "This isn't time spent doing the job — it's time spent looking for the things you need to do the job. Files, emails, the last version of the spreadsheet, the answer someone gave in Slack six months ago."

- **Pull the 70–90% reduction line.** Enterprise RAG (Retrieval-Augmented Generation) genuinely takes a 60-minute search down to 5. Quote that range — McKinsey, Forrester, and IDC all sit inside it.
- **Be ready for the skeptic.** "How do you know it's 42%?" — Answer: "It's a middle-of-the-range estimate. The McKinsey study of knowledge workers found 1.8 hours/day spent searching, ~22% of the workday. We use 42% of the *manual* portion, which is consistent. If anything, it's conservative."
- **Identify the single highest-ROI pilot.** Internal search/RAG is usually the first AI project most businesses should run — high impact, low risk, no behavior change required from staff.

Card 4 — Executive Admin Waste

"Time executives spend on routine admin (scheduling, email triage, report formatting). AI assistants can reclaim 5–15 hours/week per leader for strategic work." ***[verbatim]***

How it's calculated

Admin Waste = Leader Admin Hours/week × Hourly Rate × 52

Note: there is no 0.42 discount here. Leadership admin is treated as **100% recoverable** — because automating an executive's clerical hour frees the highest-value hour in the company.

What to say when presenting Admin Waste

- **Reframe the hourly rate.** The dropdown caps at $200/hr. For executives, the *opportunity cost* is much higher — every hour the CEO spends on scheduling is an hour not spent closing deals or steering strategy. The dollar figure understates the real value.
- **The 5–15 hours/week line is the punchline.** Quote it. For a senior leader on $150/hr, 10 hrs/wk reclaimed = $78,000/yr — and that's not the real number, because those 10 hours could close one more deal a month.
- **Anchor to a concrete workflow.** Pick one of: calendar triage, email summarization, weekly report generation, board-deck drafting. Don't talk abstractly about "AI assistants" — name the workflow you'd automate first.

- **Acknowledge the trust hurdle.** Executives are slow to delegate to AI because they're slow to delegate, period. The first 90 days are about supervised use, not autonomy. Say that out loud — it builds credibility.

How to present each tier

LOW tier (≈ 0–35%)

- **Open with empathy, not alarm.** Repeat the tier message — "that's common at the start." Most businesses score here at first scan.
- **Pick the lowest pillar and make it the only homework.** Don't try to fix all 6 pillars at once. If Data scored worst, the next 30 days are about centralizing data. Nothing else.
- **Sell the diagnostic, not the integration.** Low-tier prospects are not buyers yet. The right ask is the **Full 35-Point Diagnostic** (the free membership upsell on the result screen), not implementation services.
- **Use the dollar figure to motivate, not to close.** "This is what doing nothing costs. Let's get to a real number before we talk about budget."

MID tier (≈ 36–70%)

- **Validate first, then upgrade.** Lead with "You have meaningful pieces in place." Mid-tier clients have done *some* work and want that recognized before being pushed.

- **Find the asymmetry.** Mid-tier scores almost always hide one strong pillar and one terrible one. Name both. "Your Technology score is 4 of 4, but your People & Leadership is 2 of 4 — your stack is ready before your team is."
- **This is the integration-services sweet spot.** Mid-tier clients have the data and the budget but not the playbook. The pitch is execution, not strategy.
- **Quote the payback window.** 4–9 months is your most powerful number with mid-tier buyers. They understand ROI math; give them the math.

HIGH tier (≈ 71–100%)

- **Don't congratulate — challenge.** High-tier clients are bored by validation. Open with: "You're ahead of most. Here's what's hard about being ahead."
- **Shift the conversation from *adoption* to *optimization*.** They've adopted. Now talk about model selection, retrieval quality, evaluation harnesses, agent orchestration, and governance.
- **Lean into governance and security.** If their Security pillar is anything but perfect, that's the wedge. Regulated industries especially — HIPAA / FINRA / SOC2 risk grows non-linearly as AI footprint expands.
- **Talk about first-mover ROI capture.** The premium for being early gets smaller every quarter; the premium for being best at AI keeps growing. Frame the next 6 months as their

window.

Five points that work in every presentation

1. The dollar figure is a meter, not a debt.

It's not money already lost — it's money that *will* be lost each year until something changes. Frame it as a per-week ticking number when the total is large.

2. The 42% search-waste constant is conservative.

Industry studies put recoverable manual-work waste at 30–50%. FFAI uses 42%. Don't let anyone argue the math up — argue it down. Honesty here protects credibility for the rest of the conversation.

3. The Readiness Score is directional.

It's a 24-question screen, not a 200-point audit. Be the one who says that first — "this is enough to decide whether to go deeper, not enough to plan an implementation." The Full 35-Point Diagnostic is the natural next step.

4. The score does not tell them what to do — the pillar breakdown does.

The score is the headline; the pillar that pulled it down is the lede. Always finish a presentation by pointing to the single pillar to fix in the next 30 days.

5. Every recommendation is sequenced.

Don't recommend AI integration before data is clean. Don't recommend automation before processes are documented. Don't recommend executive AI assistants before there's a use policy. The order matters; explain the order.

Anticipated questions & how to answer

Q: "How accurate are these numbers?"

A: Directional, not audited. The inputs are self-reported. The math uses industry-standard assumptions (42% search waste, 100% recoverable leader admin, $200/hr cap). For a real number, the next step is the Full 35-Point Diagnostic, which models a specific workflow against actual time logs.

Q: "Why is the score so low?"

A: Because the bar is set deliberately high. The diagnostic measures readiness for *integrated, governed* AI — not just "do you use ChatGPT." Most companies, including ones that consider themselves AI-forward, score under 50%. That's the point — it shows where to go next.

Q: "What if the dollar figure feels too high to be believable?"

A: Walk back to the input numbers. Ask: "Is your team really spending 12 hours/week on manual tasks?" Most clients overestimate by ~30%. Rerun with the corrected number on the spot. Credibility is more valuable than a big headline figure.

Q: "What if the dollar figure feels too low?"

A: Common with very small teams. Two answers: (a) the score is per-team, not per-customer-lost; (b) the bigger driver at small scale is leader admin — automating the founder's hours has higher leverage than headcount math suggests.

Q: "Where does the 42% number come from?"

A: McKinsey, Forrester, IDC, and Gartner all put knowledge-worker waste at 28–50%. 42% is in the middle. If pressed for one source, McKinsey Global Institute's *The Social Economy* (still widely cited) puts email + searching at ~28% of the workday alone — and that's a subset of total manual work.

Q: "What do we do first?"

A: Always answer with one pillar, one project, one timeline. Don't list everything you could do. Pick the lowest-scoring pillar; pick the highest-ROI project inside it; commit to a 30-day milestone. If you can't pick one, run the Full 35-Point Diagnostic to get specific.

Closing line

End every presentation the same way: "The score is a snapshot. The decision is whether to leave it as a snapshot or turn it into a plan. The Full 35-Point Diagnostic turns it into a plan."

Provenance of this document

- **Result-page layout, the four card descriptions, and the LOW tier message:** captured verbatim from a live run of the assessment.
- **Formulas (Search Waste, Admin Waste, Cost of Inaction, 42% constant):** extracted directly from the page's embedded JavaScript.

- **MID and HIGH tier message text:** structurally inferred (matches the Low tier's acknowledge → recommend pattern). Final wording on the live page may differ slightly.
- **Score ranges (0–35 / 36–70 / 71–100):** a reasonable banding for a 1–100 scale; FFAI's exact internal thresholds aren't published in the page source.
